

FlowUI Documentation

Overview

FlowUI is a lightweight, designer-friendly UI navigation framework built to simplify menu management in Unity.
Create structured, predictable UI flows in minutes — without spaghetti code or complex setups.

Perfect for mobile games, solo developers, small teams, prototypes, and hypercasual projects.

Supported UI System

FlowUI is designed exclusively for Unity's built-in Canvas-based UI (uGUI).

It does NOT support:

- UI Toolkit
- ImGui
- Custom rendering frameworks

Scene Requirements

Your scene must include:

- A Canvas
- An EventSystem

Most Unity UI scenes already contain these by default.
Without an EventSystem, UI interactions will not work.

FlowUI does not modify your Canvas setup and works with any render mode.

Key Concepts

Pages represent root UI screens such as menus, panels, or popups.

Each page:

- Has a unique ID
- Registers automatically at startup
- Can be opened via UIManager

FlowUI uses two independent stacks:

Main Stack — Handles primary screens (Home, Settings, Gameplay)

Overlay Stack — Handles popups layered on top (Pause, Confirm dialogs)

Navigation is ID-based, allowing you to open pages safely without fragile references.

Installation

1. Import the FlowUI package.
2. Add UIManager to your scene.
3. Create your UI Pages.
4. Add the Page component to each root UI object.
5. Assign a unique ID.
6. Add NavButton to your buttons.

Quick Start

Create your first flow in under 2 minutes.

- 1) Add UIManager — Place it anywhere in your scene and set your Default Page ID.
- 2) Setup Pages — Ensure each GameObject is ACTIVE at startup, add the Page component, and assign a unique ID.
Pages must be active so they can auto-register.
- 3) Setup Buttons — Add NavButton and select an action:
OpenTo, OpenOverlay, Back, CloseAll, OpenDefault.
- 4) Press Play — FlowUI handles the rest.

Navigation Rules

OpenTo(id)

- Closes all overlays
- Shows the target page
- Pushes it to the Main Stack

OpenOverlay(id)

- Displays a page above the current main page
- Adds it to the Overlay Stack

Back()

Priority:

1. Close the top overlay
2. Return to the previous main page
3. Do nothing if at root

Transitions

FlowUI supports optional transitions via UnityEvents.

Each Page can define:

- Enter transition
- Exit transition
- Duration

Compatible with Animator, CanvasGroup, Timeline, or custom scripts.
No dependencies required.

Requirements

FlowUI requires Unity's standard Canvas UI system.

Before using FlowUI, ensure your scene contains:

- A Canvas
- An EventSystem

Pages must be ACTIVE at startup so they can register automatically.
Inactive pages will not be detected.

Best Practices

- Keep page IDs unique
- Use short, readable IDs (home, settings)
- Avoid renaming IDs at runtime
- Use overlays for modal UI
- Keep navigation predictable

FAQ

Do I need Animator?

No. Transitions are optional.

Does FlowUI support mobile?

Yes — it was designed with mobile-first workflows in mind.

Can I use it without transitions?

Absolutely.

Is it safe against button spam?

Yes. Navigation is blocked during transitions.

Does FlowUI support UI Toolkit?

No. FlowUI is built specifically for Unity's Canvas-based UI system.

Are visuals included?

Demo visuals are for demonstration purposes only and are not included.
